Section V

1. Reference is made to the following documents:

> D1: Proceedings TAS 96, Analytical Methods & Instrumentation, Special Issue μTAS'96, 1996, pages 124-125.

4 . :

D2: WO 98/49344 D3: US 5 585 069 D4: EP 0 649 534

2. The subject-matter of claim 1 is an apparatus comprising the following features: a) at least one reaction chamber; b) at least one fluid inflow channel communicating with the (or each) reaction chamber; and c) gate means adapted to prevent passage of aqueous fluid through the fluid inflow channel(s) into the reaction chamber(s) before a fluid entry force is applied; the gate means being characterised by at least the (or each) inflow channel having an hydrophobic inner surface.

D1 shows the detection of single DNA Molecules and DNA fragment analysis in moulded silicone elastomer microchips. An micro-channel device carrying a variety of channel layouts for specific applications and made out of the silicone elastomer polydimethylsiloxane (PDMS, an hydrophobic material) is described. The required buffer solutions and separation media are introduced in the channels by vacuum or by applying force of up to 1 bar (see page 124).

D2 relates to a method for analysing nucleic acids which comprises: (a) forming a micro channel structure in a substrate; (b) treating at least a portion of the micro channel structure to produce a pattern of reactive, hydrophilic sites; (c) applying a different aqueous probe solution to each hydrophilic site to couple a number of probes to the micro channel structure, and (d) affixing a cover plate to the substrate to enclose the micro channel structure. Also claimed is an apparatus for carrying out the above mentioned method, wherein the surface of the micro channel structure is treated with an hydrophobic substance, thus forming an hydrophobic layer, and comprising means for electro kinetically or hydraulically transporting the fluid sample to the reactive probes sites (see claim 33 to 37).

From the above analysis of the prior art, the apparatus of claim 1 is not novel because the prior art devices already had the inflow channel(s) having an hydrophobic inner surface - the so called "gate means" in feature c) of claim 1- and present the same advantages: introduction of the liquids achieved only by application of a fluid entry force. Hence, the subject-matter of claim 1 does not fulfil the requirements of Article 33(2) PCT.

- 3. The additional features introduced by the dependent claims 2-46 cannot be combined with the features of claim 1 to form a basis for inventive subject-matter. because the features introduced by these claims relate to details of construction that are either disclosed in the prior art documents cited in the search report or relate to standard options in the art (see D1 pages 124-125; D2 claims 33-68 and figures; D3 claims and figures, and D4 claims and figures).
- The subject-matter of independent claim 47 (referring to a method of manufacturing 4. the apparatus of the application) and of the claims 48-52 dependent thereon is also anticipated by the disclosures in document D1 (see pages 124 and 125) and in document D2 (see claims 1-20). Hence, the subject-matter of claims 47-52 does not fulfil the requirements of Article 33(2) PCT.
- 5. The subject-matter of independent claim 53 (referring to a method of operating the apparatus of the application) and of the claims 54-59 dependent thereon is also anticipated by the disclosures in the prior art documents D1 (see page 124) and D2 (see claims 66-68). Thus, the subject-matter of claims 53-59 does not fulfil the requirements of Article 33(2) PCT.
- 6. The newly filed claims 48-54 do not contravene the requirements of Article 34 (2) b) PCT.

2. Citations and explanations see separate sheet

Section V

Reference is made to the following documents: 1.

D1: Proceedings TAS 96, Analytical Methods & Instrumentation, Special Issue μTAS'96, 1996, pages 124-125.

D2: WO 98/49344 D3: US 5 585 069 D4: EP 0 649 534

The subject-matter of claim 1 is an apparatus comprising the following features: a) 2. at least one reaction chamber; b) at least one fluid inflow channel communicating with the (or each) reaction chamber; and c) gate means adapted to prevent passage of aqueous fluid through the fluid inflow channel(s) into the reaction chamber(s) before a fluid entry force is applied; the gate means being characterised by at least the (or each) inflow channel having an hydrophobic inner surface.

D1 shows the detection of single DNA Molecules and DNA fragment analysis in moulded silicone elastomer microchips. An micro-channel device carrying a variety of channel layouts for specific applications and made out of the silicone elastomer polydimethylsiloxane (PDMS, an hydrophobic material) is described. The required buffer solutions and separation media are introduced in the channels by vacuum or by applying force of up to 1 bar (see page 124).

D2 relates to a method for analysing nucleic acids which comprises: (a) forming a micro channel structure in a substrate; (b) treating at least a portion of the micro channel structure to produce a pattern of reactive, hydrophilic sites; (c) applying a different aqueous probe solution to each hydrophilic site to couple a number of probes to the micro channel structure, and (d) affixing a cover plate to the substrate to enclose the micro channel structure. Also claimed is an apparatus for carrying out the above mentioned method, wherein the surface of the micro channel structure is treated with an hydrophobic substance, thus forming an hydrophobic layer, and comprising means for electro kinetically or hydraulically transporting the fluid sample to the reactive probes sites (see claim 33 to 37).

From the above analysis of the prior art, the apparatus of claim 1 is not novel because the prior art devices already had the inflow channel(s) having an hydrophobic inner surface - the so called "gate means" in feature c) of claim 1- and

present the same advantages: introduction of the liquids achieved only by application of a fluid entry force. Hence, the subject-matter of claim 1 does not fulfil the requirements of Article 33(2) PCT.

- The additional features introduced by the dependent claims 2-46 cannot be 3. combined with the features of claim 1 to form a basis for inventive subject-matter, because the features introduced by these claims relate to details of construction that are either disclosed in the prior art documents cited in the search report or relate to standard options in the art (see D1 pages 124-125; D2 claims 33-68 and figures; D3 claims and figures, and D4 claims and figures).
- The subject-matter of independent claim 47 (referring to a method of manufacturing 4. the apparatus of the application) and of the claims 48-52 dependent thereon is also anticipated by the disclosures in document D1 (see pages 124 and 125) and in document D2 (see claims 1-20). Hence, the subject-matter of claims 47-52 does not fulfil the requirements of Article 33(2) PCT.
- 5. The subject-matter of independent claim 53 (referring to a method of operating the apparatus of the application) and of the claims 54-59 dependent thereon is also anticipated by the disclosures in the prior art documents D1 (see page 124) and D2 (see claims 66-68). Thus, the subject-matter of claims 53-59 does not fulfil the requirements of Article 33(2) PCT.

PCT/EP00/02887

International application No.

ECOLE POLYTECHNIQUE FEDERALE DE LAUSANNE

- 1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- 2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

I. Basis of the report

1.	With regard to the elements of the international application (Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17)): Description, pages:							
	1-2	3	as originally filed					
	Claims, No.:							
	1-4	7,55-59	as originally filed					
	48-	54	as received on	27/04/2001	with letter of	20/04/2001		
	Drawings, sheets:							
	1/1:	2-12/12	as originally filed					
						•		
2. With regard to the language, all the elements marked above were available or furnished to this Auth language in which the international application was filed, unless otherwise indicated under this item. These elements were available or furnished to this Authority in the following language: , which is:					nder this item.			
		the language of a	translation furnished for the	e purposes of the i	nternational searc	h (under Rule 23.1(b)).		
3.	With regard to any nucleotide and/or amino acid sequence disclosed in the international application, the international preliminary examination was carried out on the basis of the sequence listing:							
		contained in the in	ternational application in w	ritten form.				
		filed together with the international application in computer readable form.						
	furnished subsequently to this Authority in written form.							
		☐ furnished subsequently to this Authority in computer readable form.						
		☐ The statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.						
		The statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.						

4. The amendments have resulted in the cancellation of:

		the description,	pages:				
		the claims,	Nos.:				
		the drawings,	sheets:				
5.		This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):					
		(Any replacement she report.)	eet contaii	ning such	h amendments must be referred to under item 1 and annexed to this		
6.	Additional observations, if necessary:						
V.	Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement						
1. Statement				· · · · · · · · · · · · · · · · · · ·

INTERNATIONAL PRELIMINARY **EXAMINATION REPORT - SEPARATE SHEET**

Section V

1. Reference is made to the following documents:

D1: Proceedings TAS 96, Analytical Methods & Instrumentation, Special Issue μTAS'96, 1996, pages 124-125.

D2: WO 98/49344 D3: US 5 585 069 D4: EP 0 649 534

2. The subject-matter of claim 1 is an apparatus comprising the following features: a) at least one reaction chamber; b) at least one fluid inflow channel communicating with the (or each) reaction chamber; and c) gate means adapted to prevent passage of aqueous fluid through the fluid inflow channel(s) into the reaction chamber(s) before a fluid entry force is applied; the gate means being characterised by at least the (or each) inflow channel having an hydrophobic inner surface.

D1 shows the detection of single DNA Molecules and DNA fragment analysis in moulded silicone elastomer microchips. An micro-channel device carrying a variety of channel layouts for specific applications and made out of the silicone elastomer polydimethylsiloxane (PDMS, an hydrophobic material) is described. The required buffer solutions and separation media are introduced in the channels by vacuum or by applying force of up to 1 bar (see page 124).

D2 relates to a method for analysing nucleic acids which comprises: (a) forming a micro channel structure in a substrate; (b) treating at least a portion of the micro channel structure to produce a pattern of reactive, hydrophilic sites; (c) applying a different aqueous probe solution to each hydrophilic site to couple a number of probes to the micro channel structure, and (d) affixing a cover plate to the substrate to enclose the micro channel structure. Also claimed is an apparatus for carrying out the above mentioned method, wherein the surface of the micro channel structure is treated with an hydrophobic substance, thus forming an hydrophobic layer, and comprising means for electro kinetically or hydraulically transporting the fluid sample to the reactive probes sites (see claim 33 to 37).

From the above analysis of the prior art, the apparatus of claim 1 is not novel because the prior art devices already had the inflow channel(s) having an hydrophobic inner surface - the so called "gate means" in feature c) of claim 1- and **EXAMINATION REPORT - SEPARATE SHEET**

present the same advantages: introduction of the liquids achieved only by application of a fluid entry force. Hence, the subject-matter of claim 1 does not fulfil the requirements of Article 33(2) PCT.

- 3. The additional features introduced by the dependent claims 2-46 cannot be combined with the features of claim 1 to form a basis for inventive subject-matter. because the features introduced by these claims relate to details of construction that are either disclosed in the prior art documents cited in the search report or relate to standard options in the art (see D1 pages 124-125; D2 claims 33-68 and figures; D3 claims and figures, and D4 claims and figures).
- The subject-matter of independent claim 47 (referring to a method of manufacturing 4. the apparatus of the application) and of the claims 48-52 dependent thereon is also anticipated by the disclosures in document D1 (see pages 124 and 125) and in document D2 (see claims 1-20). Hence, the subject-matter of claims 47-52 does not fulfil the requirements of Article 33(2) PCT.
- 5. The subject-matter of independent claim 53 (referring to a method of operating the apparatus of the application) and of the claims 54-59 dependent thereon is also anticipated by the disclosures in the prior art documents D1 (see page 124) and D2 (see claims 66-68). Thus, the subject-matter of claims 53-59 does not fulfil the requirements of Article 33(2) PCT.
- 6. The newly filed claims 48-54 do not contravene the requirements of Article 34 (2) b) PCT.

48. A method according to claim 47, wherein apparatus is formed from polymeric material.

- 49. A method according to claim 48, wherein the apparatus is formed by injection moulding, hot embossing, 5 photoablation, casting, or polymerisation on a mould.
- 50. A method according to claim 48 or claim 49, comprising the steps of forming a substrate having at least one depression therein, and applying an overlying layer over the substrate to seal the or each depression so as to form 10 at least one fluid inflow channel and/or at least one reaction chamber.
 - 51 A method according to claim 50, wherein the overlying layer is sealed with the substrate by thermal lamination.
- 15 52. A method according to claim 47, wherein at least a part of the apparatus is formed of a ceramics material, glass, a conductor or a semi-conductor material.
- 53. A method of operating an apparatus according to any of claims 1 to 46, comprising the steps of: placing at 20 least one sample of an aqueous solution under test at the end of at least one fluid inflow channel distal at least one reaction chamber/; causing the sample to enter the reaction the process chamber(s) via the fluid inflow channel(s) by applying a fluid entry force; and monitoring the sample in the reaction 25 chamber(s); for the presence or concentration, of a target substance.
- 54. A method according to claim 53, wherein the sample(s) is caused to exit the reaction chamber(s) before the reaction chamber(s) or the expelled sample is monitored 30 for the presence or concentration of a target substance.
- * , at least a portion of the or each fluid inflow channel having a hydrophobic inner surface

TELECOPIER

European Patent Office, D-80298 München, GERMANY.

Attn: International Preliminary Examining Authority

RTM/SMG

20th April 2001.

Dear Sirs,

International Patent Application PCT/EP00/02887 École Polytechnique Fédérale de Lausanne

I refer to the written opinion dated 20^{th} November 2000 and to the communications regarding the extensions of the time limit in which to reply dated 26^{th} February 2001 and 23^{rd} March 2001.

I enclose herewith in triplicate replacement page 30 containing an amendment to Claim 53, and I ask that this page be substituted for the existing page of that number.

The amendment to Claim 53 is supported by the description at page 6 lines 30 to 32 and page 9 lines 1 to 2.

At item 2 of the written opinion the Examiner states that from an analysis of the prior art documents D1 and D2 "the apparatus of claim 1 is not novel because the prior art devices already had the inflow channel(s) having an hydrophobic inner surface - the so called "gate means" in feature c) of claim 1 (as identified by the Examiner) - and present the same advantages: introduction of the liquids achieved only by application of a fluid entry force. Hence, the subject-matter of claim 1 does not fulfil the requirements of Article 33(2) PCT".

D1 discloses a micro-channel device capable of carrying a variety of channel lay-outs for specific applications (see page 124 column, third paragraph), however D1 is solely concerned with the detection of single DNA molecules and DNA fragment analysis in moulded silicone elastomer microchips using fluorescent dyes. D1 does not suggest that the device described therein could be used to perform other chemical assays.

International Patent Application PCT/EP00/02887 École Polytechnique Fédérale de Lausanne

Furthermore, D1 does not disclose feature a) of Claim 1 of the present invention as identified by the Examiner i.e. at least one reaction chamber.

The device of D1 is made from polydimethylsiloxane (PDMS) (see page 124 column 2 second paragraph) which hydrophobic material. However, the authors of D1 do not state nor do they suggest that the hydrophobic properties of this material are important to the proper functioning of device. It is also clear that all of the surfaces of the device of D1 are hydrophobic not just the fluid inflow channel as defined in the present application. In contrast only a portion of the device disclosed in the present application, namely the fluid inflow channel, is at least partially hydrophobic. The gating effect of the present invention is provided by the different hydrophobicities between the surface of the fluid inflow channel and the micro-channel network of the apparatus. The difference in hydrophobicity between the surface of the fluid inflow channel and the micro-channel network means that flow is possible before and/or after the gate. The gate of the present invention serves to stop the flow of aqueous solutions into the micro-channel network of the apparatus.

D1 does not disclose or suggest a fluid inflow channel providing gated access to a reaction chamber. Therefore Claim 1 of the present application is novel and inventive over D1.

With respect to D2 the Examiner states that D2 also claims an apparatus for carrying out a method "wherein the surface of the micro channel structure is treated with a hydrophobic substance, thus forming a hydrophobic layer, and comprising means for electro kinetically or hydraulically transporting the fluid sample to the reactive probe sites (see claim 33 to 37)".

In fact Claim 37 of D2 refers to the deposition of a hydrophobic layer on the surface of a microchannel structure at least a portion of which is removed to form a pattern of exposed sites. In this regard I would draw the Examiner's attention to page 8 lines 13-21 where it is stated that:

These spots may then be treated with a silane coupling agent as described above to produce reactive,

International Patent Application PCT/EP00/02887 École Polytechnique Fédérale de Lausanne

hydrophilic spots. An aqueous probe solution applied to an individual spot would be confined to its hydrophilic site and thus prevented from mixing with different probe solutions in adjacent spots. The intervening hydrophobic regions would also prevent probe mixing in the case of the other immobilization methods described above.

The hydrophobic regions disclosed in D2 are used to separate individual probes on the surface of the microchannel network. D2 does not disclose nor does it suggest a fluid inflow channel providing gated access to a reaction chamber.

Therefore Claim 1 of the present application is novel and inventive over D2.

With regard to item 3 of the written opinion it is submitted that Claim 1 is novel and inventive; therefore the novelty and inventiveness of any claims dependent thereon does not have to be examined.

In item 4 of the written opinion the Examiner considers that the subject-matter of independent Claim 47 and the claims dependent thereon is anticipated by the disclosures in document D1 and D2.

Neither D1 nor D2 disclose a method of manufacture of an apparatus having the feature "at least a portion of the or each fluid inflow channel having a hydrophobic inner surface adapted to act as gate means to prevent passage of fluid through the fluid inflow channel into the reaction chamber until such fluid is acted upon by a fluid entry force". Therefore, Claim 47 of the present application is novel and inventive over D1 and D2 for the reasons given in relation to Claim 1 above.

Similarly, at item 5 of the written opinion the Examiner states that the subject-matter of independent Claim 53 and of the claims dependent thereon is also anticipated by the disclosures in the prior art documents D1 and D2.

Claim 53 has been amended to include the feature "at least a portion of the or each fluid inflow channel having a hydrophobic inner surface".

Page 4

20th April 2001.

International Patent Application PCT/EP00/02887 École Polytechnique Fédérale de Lausanne

The addition of this feature distinguishes the subject matter of Claim 53 from either D1 or D2 for the reasons indicated above.

I look forward to receiving a more favourable International Preliminary Examination Report.

Yours faithfully,

ROSS T. MANATON

Encl.

- 48. A method according to claim 47, wherein the apparatus is formed from polymeric material.
- 49. A method according to claim 48, wherein the apparatus is formed by injection moulding, hot embossing, 5 photoablation, casting, or polymerisation on a mould.
- 50. A method according to claim 48 or claim 49, comprising the steps of forming a substrate having at least one depression therein, and applying an overlying layer over the substrate to seal the or each depression so as to form 10 at least one fluid inflow channel and/or at least one reaction chamber.
 - 51. A method according to claim 50, wherein the overlying layer is sealed with the substrate by thermal lamination.
- 15 52. A method according to claim 47, wherein at least a part of the apparatus is formed of a ceramics material, glass, a conductor or a semi-conductor material.
- 53. A method of operating an apparatus according to any of claims 1 to 46, comprising the steps of: placing at 20 least one sample of an aqueous solution under test at the end of at least one fluid inflow channel distal at least one reaction chamber; causing the sample to enter the reaction chamber(s) via the fluid inflow channel(s) by applying a fluid entry force; and monitoring the sample in the reaction 25 chamber(s) for the presence or concentration of a target substance.
- 54. A method according to claim 53, wherein the sample(s) is caused to exit the reaction chamber(s) before the reaction chamber(s) or the expelled sample is monitored 30 for the presence or concentration of a target substance.
- *, at least a portion of the or each fluid inflar channel having a hydrophobic inter surface
